

# Get Control of Your DOAS

A Dedicated Outdoor Air System (DOAS) is designed to provide zone-level ventilation and save energy, but achieving those goals requires effective control. A DOAS with a high-density thermal dispersion airflow measurement and an integrated RH sensor validates the ventilation system design, optimizes energy, and maintains dew point and enthalpy values.

With the EBTRON Gold Series, you can achieve a positive outside air correction factor (OACF), reducing the exhaust air transfer ratio (EATR), which results in less contamination of ventilation air. In addition, determine the enthalpy recovery ratio, maintain airflow for desired building pressure, and control discharge air dew point..

EBTRON is a measurable difference.
