1 GTL116 TRANSMITTER INSTALLATION

The GTL116 transmitter is designed for use in an environment between -20° F to 120° F (-28.8° C to 48.8° C) where it will not be exposed to rain or snow. Install transmitter upright and in a field accessible location. The enclosure accepts 1/2 in. (12.7 mm) electrical fittings for signal and power wiring at both sides at the top of the enclosure.

Locate the transmitter so that the connecting cables from all of the sensor probes will reach the receptacles on the bottom of the transmitter enclosure.

⚠️ In locations exposed to direct rain and/or snow, the transmitter must be enclosed in a NEMA4 enclosure.

⚠️ Leave unobstructed space of at least 9 in. (228.6 mm) above, 2 in. (50.8 mm) to each side and 3.5 in. (88.9 mm) below the transmitter to allow for cover removal, sensor connections and heat dissipation.

⚠️ Locate the transmitter in a location that can be reached by all connecting cables from the sensor probes.

⚠️ Do not drill into the transmitter enclosure since metal shavings could damage the electronics.

1.1 GTL116 Mechanical Dimensions

Figure 1. GTL116 Mechanical Dimensions
GOLD SERIES GTL116 TRANSMITTER

2 GTL116 TRANSMITTER INTERIOR VIEW/FEATURES

Output signal terminals
(Note: The output function is dependent on which network card is installed)

LCD contrast

Transmitter status LED
(Green 1 second flash normal; 2 second flash for fault)

High accuracy A/D converter

Gold plated interconnects to optional output cards

Positive locking cable receptacles with gold interconnects

Power switch

Switching power supply conserves energy and reduces heat

Pushbutton interface simplifies field configuration
(Note: devices are plug and play and generally do not require configuration.)

Expansion port

Multiplexers independently measure sensor voltages from 1 up to 16 sensing points

Gold plated interconnects to sensor input receptacles

Figure 2. GTL116 Transmitter Interior View/Features
3 GOLD SERIES GTL116 TRANSMITTER

3.1 Power Transformer Selection

Select a 24 VAC transformer based on the maximum power requirements indicated on the transmitter label (20 VA) or from the table below. The operating supply voltage (transmitter power “ON” with all sensor probes connected) should not be less than 22.8 VAC or greater than 26.4 VAC.

Table 1. GTL116 Power Transformer Selection Guide

3.2 Connecting Power to the Transmitter

Connect 24 VAC power to the large, two position power input terminal labeled “POWER” on the upper right hand side of the main circuit board (Figure 3). Since the output signals are isolated from the power supply, it is not necessary to provide an isolated (secondary not grounded) power source.

⚠️ Multiple GTL116 transmitters wired to a single transformer must be wired “in-phase” (L1 to L1, L2 to L2).
3.3 Connecting Sensor Probes to the Transmitter

After installing the sensor probes and transmitter, connect each of the sensor probe cable plugs to the circular receptacles located at the bottom of the GTL116 transmitter enclosure. Probes are “Plug and Play” and do not have to be connected to a specific receptacle on the transmitter unless traverse data is desired (see note below). Transmitters accept only GP1 and GB1 sensors.

- Provide a “drip loop” at the transmitter if there will be the potential for water runoff or condensation along the sensor probe cable(s).
- Sensor probe cable plugs are “keyed” as shown below. Line up plug with receptacle and push straight on to receptacle.
- DO NOT TWIST. Squeeze cable plug “ribs” towards receptacle when removing. Forcing the cable plug in or out of the receptacle will damage the connectors and void warranty.
- When traverse data is desired (especially when using the EB-Link Reader), probes should be installed and connected to the transmitter using the mounting convention specified in the separate GP1/GB1 sensor probe Installation Guide. Proper installation simplifies sensor location decoding during data analysis.

![Figure 4. Type A and Type B Transmitter Connector Panel Detail](image)

![Figure 5. Connector Detail](image)
4 GTL116 LONWORKS NETWORK CONNECTIONS

This section contains network output wiring instructions for the GTL116 transmitter with Lonworks output.

4.1 GTL116 - LONWORKS NETWORK WIRING CONNECTIONS

To wire the output signal, slide the cover plate up and off of the enclosure. Ensure that the power switch is in the “OFF” position. Connect the transmitter output to the LonWorks bus in a “daisy-chain” configuration, using the OUTPUT terminals as shown in Figure 6. Use shielded twisted pair cable.

<table>
<thead>
<tr>
<th>OUTPUT TERMINAL</th>
<th>SIGNAL DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>NET +</td>
</tr>
<tr>
<td>2</td>
<td>NET -</td>
</tr>
<tr>
<td>(NOT USED: COMMON)</td>
<td>(NOT USED)</td>
</tr>
</tbody>
</table>

The shield is typically grounded at one end of the bus, and is therefore not connected to the transmitter terminals.

Figure 6. GTL116 LonWorks Transmitter Interior Detail
4.2 GTL116 - Transmitter Setup for LonWorks Operation

The GTL116 includes a full featured LonWorks compatible interface. The GTL116 may be pre-configured using the EBTRON_116.XIF file (available for download at http://www.ebtron.com/downloads/EBTRON_116.XIF) or can be configured at installation via direct LonWorks parameter upload from the GTL116 transmitter. A "Service" push-button and indicator LED are provided for standard installation. A “Wink” LED is provided for easy device identification. An “Activity” LED and separate transmit and receive “TX” and “RX” indicators provide visual indication of transmitter and communication status. The “Activity” LED normally flashes on for 1 second, off for 1 second when the card is commissioned and online, and remains illuminated constantly if there is an error.

4.3 GTL116 - LonWorks Interface

4.3.1 GTL116 - Introduction

The Ebtron LonWorks interface adapter provides an output for connection to an Echelon LonWorks compatible network. Two basic function blocks are provided. These are a node object and a gtx116 function block. The node object is used for overhead activities on the LonWorks bus and is of little interest to the end user. The gtx116 function block contains a set of network variables and configuration properties that allow the end user to monitor various parameters related to airflow, pressure, and temperature provided by the transmitter.

Tables 2 through 8 describe each of the variables used and the configuration properties for each. There are configuration properties that apply to multiple objects, but may not be listed directly under them when viewed on the network. Check the "applies to" tag in the description for the configuration property in the following sections.

**NOTE**

Units shown are default values and, depending on software used, may be set automatically by location.

4.3.2 GTL116 - Velocity and Flow Variables Configuration

This section details the airflow and air velocity variables and how the configuration properties relate to them.

4.3.3 GTL116 - Velocity and Flow Variables

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Variable Type</th>
<th>Measurement</th>
<th>Type Category</th>
<th>Type Resolution</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvoAirVel</td>

<td>Linear Velocity</td>
<td>Unsigned Long</td>
<td>0.001</td>
<td>Meters/second</td>
</tr>
<tr>
<td>nvoAirFlow</td>
<td>SNVT_flow</td>
<td>Flow Volume</td>
<td>Unsigned Long</td>
<td>1</td>
<td>Liters/sec</td>
</tr>
<tr>
<td>nvoAirFlowFl</td>
<td>SNVT_flow_f</td>
<td>Flow Volume</td>
<td>Floating Point</td>
<td>n/a</td>
<td>Liters/sec</td>
</tr>
</tbody>
</table>

For the "nvoAirFlow" and "nvoAirFlowFl" variables to be meaningful, the ductArea configuration property must be set.

*nvoAirVel (SNVT_speed_mil - Air Velocity)*

This variable provides simple linear airflow in meters/second.

*nvoAirFlow (SNVT_flow - Airflow)*

This variable provides volumetric airflow in liters/sec. For this variable to be meaningful, the ductArea configuration property must be set.

*nvoAirFlowFl (SNVT_flow_f - Airflow Float)*

This variable provides volumetric airflow in liters/sec. For this variable to be meaningful the ductArea configuration property must be set.
4.3.4 GTL116 - Velocity and Flow Configuration Properties

Table 3. GTL116 LonWorks Node Velocity and Flow Configuration Properties

<table>
<thead>
<tr>
<th>Air Flow Sensor Configuration Properties</th>
<th>Type</th>
<th>Measurement</th>
<th>Resolution</th>
<th>Units</th>

<td>Area</td>
<td>Unsigned Long</td>
<td>0.0002</td>
<td>Square Meters</td>
</tr>
</tbody>
</table>

*nvoAirVel (SCPTmaxSendTime - Maximum Time Between Updates)*

This configuration property sets the maximum time to elapse between updates to the network for velocity and flow to occur.

*nvoAirVel (SCPTminSendTime - Minimum Time Before Updates)*

This configuration property sets the minimum time to elapse before an update to the network for velocity and flow may be sent. This configuration property takes priority over maxSendTime and sndDelta.

*nvoAirVel (SCPTsndDelta - Minimum Change for Update)*

This configuration property sets the minimum change in velocity that will cause an update of flow and velocity to the network. The change is only checked for in velocity, and when the minimum is reached updates will occur for nvoVel, nvoFlow, and nvoFlowFl.

*nvoAirFlow (SCPTductArea - Duct Area for Air Flow Calculation)*

This configuration property sets the duct area to be used in flow calculations. Note that this variable must be set to a non-zero value to get flow information.

4.3.5 GTL116 - Area Input Variable

This section details the network input variable area.

Table 4. GTL116 LonWorks Area Input Variable

<table>
<thead>
<tr>
<th>Area Object</th>
<th>Variable Name</th>
<th>Variable Type</th>
<th>Measurement</th>
<th>Type Category</th>
<th>Type Resolution</th>
<th>Units</th>
</tr>

<td>nviArea</td>
<td>SNVT_area</td>
<td>Area</td>
<td>Unsigned Long</td>
<td>0.0002</td>
<td>Square Meters</td>
</tr>
</tbody>
</table>

This network input sets the duct area to be used in flow calculations. This variable is essentially a copy of nvoAirFlow:SCPTductArea; only one of these inputs needs to be configured before using nvoAirFlow or nvoAirFlowFl.
4.3.6 GTL116 - Pressure Variables and Configuration
This section details the pressure variables and how the configuration properties relate to them.

Table 5. GTL116 LonWorks Node Pressure Variables

<table>
<thead>
<tr>

<td>SNVT_press_f</td>
<td>Pressure</td>
<td>Floating Point</td>
<td>n/a</td>
<td>PA</td>
</tr>
</tbody>
</table>

nvoPrecisePres (SNVT_press_p - Airflow Pressure)
This variable provides pressure in Pascal. For this variable to be meaningful a bleed sensor must be attached to the transmitter.

nvoFloatPres (SNVT_press_f - Airflow Pressure Float)
This variable provides pressure in Pascal. For this variable to be meaningful a bleed sensor must be attached to the transmitter.

4.3.7 GTL116 - Pressure Configuration Properties

Table 6. GTL116 LonWorks Node Pressure Configuration Properties

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>SNVT</th>
<th>Measurement</th>
<th>Type Category</th>
<th>Type Resolution</th>
<th>Units</th>

<td>SCPsndDelta</td>
<td>Pressure</td>
<td>Signed Long</td>
<td>0.0001</td>
<td>PA</td>
</tr>
</tbody>
</table>

nvoPrecisePres (SCPmaxSendTime - Maximum Time Between Updates)
This configuration property sets the maximum time to elapse between updates to the network for pressure to occur.

nvoPrecisePres (SCPminSendTime - Minimum Time Before Updates)
This configuration property sets the minimum time to elapse before an update to the network for pressure may be sent. This configuration property takes priority over maxSendTime and sndDelta.

nvoPrecisePres (SCPsndDelta - Minimum Change for Update)
This configuration property sets the minimum change in pressure that will cause an update for pressure to the network. When this change is met both nvoPrecisePres and nvoFloatPres will be updated on the network.

4.3.8 GTL116 - Temperature Variables and Configuration Properties
This section details the temperature variable and how the configuration properties that relate to it.

Table 7. GTL116 LonWorks Node Temperature Variable

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>SNVT</th>
<th>Measurement</th>
<th>Type Category</th>
<th>Type Resolution</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>

<td>SNVT_temp_p</td>
<td>Temperature</td>
<td>Signed Long</td>
<td>0.01</td>
<td>Degrees C</td>
</tr>
</tbody>
</table>

nvoTemp (SNVT_temp_p - Temperature Variable)
This network variable provides temperature in degrees Celsius.
4.3.9 GTL116 - Temperature Configuration Properties

Table 8. GTL116 LonWorks Node Temperature Configuration

<table>
<thead>
<tr>
<th>Temperature Sensor Configuration Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
</tr>
<tr>
<td>------------------</td>
</tr>
<tr>
<td>nvoTemp</td>
</tr>
<tr>
<td>nvoTemp</td>
</tr>
<tr>
<td>nvoTemp</td>
</tr>
</tbody>
</table>

**nvoTemp (SCPTmaxSendTime - Maximum Time Between Updates)**

This configuration property sets the maximum time to elapse between updates to the network for temperature to occur.

**nvoTemp (SCPTminDeltaTemp - Minimum Change for Update)**

This configuration property sets the minimum change in temperature that will cause an update of nvoTemp to the network.

**nvoTemp (SCPTminSendTime - Minimum Time Before Updates)**

This configuration property sets the minimum time to elapse before an update to the network for temperature may be sent. This configuration property takes priority over maxSendTime and minDeltaTemp.

4.4 GTL116 - Default Delta Values

The default Delta values determine when updates are sent from the transmitter to the network. The factory default Delta values are set to a large enough value to prevent any undesired messages from being sent to the network. Refer to the preceding paragraphs for description and configuration of the Delta values.
5 GTL116 TRANSMITTER START-UP, INITIALIZATION AND SETUP MENUS

To ensure a successful start-up, verify that the airflow measuring station sensor probes and transmitter are installed in accordance with EBTRON guidelines.

⚠️ Check the physical installation, power connections and model specific signal wiring prior to turning the power switch to the “ON” position.

Move the power switch to the “ON” position. The transmitter executes a complete self-check each time the power is turned on that takes 10 seconds to complete.

The GTL116 must be properly configured for the LonWorks network. Review section 4.6 of this document for detail, or contact EBTRON Customer Service, toll free, at 800-232-8766.

5.1 Changing the System of Units - IP or SI Units

The GTL116 transmitter is provided with the system of units set to IP. To change to SI units, simultaneously press and release the “ENT” and “ESC” buttons during normal operation. “IP/SI UNITS” will be indicated on the LCD display. Refer to Appendix A SYSTEM OF UNITS MENU for details on the System of Units menu. Note that Setup Menu items are shown in IP System Of Units. When SI System of Units is selected, the units of measure abbreviations used in the menus is shown in Table 9.

Table 9. Standard “IP” and “SI” Menu Units Abbreviations

</tr>
</tbody>
</table>

5.2 GTL116 Transmitter Calibration

The GTL116 uses high quality industrial grade components and is designed for years of trouble-free operation. Periodic recalibration of the transmitter is neither required or recommended. Transmitter field calibration verifiers are available for purchase from EBTRON for installations requiring periodic validation of instrumentation. Contact EBTRON for more information.

5.3 GTL116 LCD Display Notifications

Following a brief initialization at power up, the LCD display automatically displays airflow and temperature with units of measurement in all upper case (caps) characters. The display provides additional information on system status and alarm conditions. Refer to the ALARM FEATURES section of this manual for additional detail on Alarm and Trouble Error code indications.
5.4 Factory Default Menu Settings for GP1 Sensor Probes

The GTL116 transmitter is “plug and play” and does not require setup unless a network option is selected that requires configuration. Table 10 shows the factory default settings for all compatible sensor probes. To change the Factory Default Settings, see: CHANGING FACTORY DEFAULT SETUP MENU SETTINGS.

Table 10. Factory Default Menu Settings

</tbody>
</table>

Note: For GP1 probes, area is stored in one-wire, but can be changed.

5.5 GTL116 Changing Factory Default Setup Menu Settings

5.5.1 Setup Menu Options

The GTL116 Transmitter is setup and tested at the factory to be fully operational when sensor probes are connected and power is applied (set the power switch to the “ON” position). Factory settings can easily be changed using the SETUP MENU by simultaneously pressing and releasing the “UP” and “DOWN” buttons while the transmitter is in its normal operating mode. Appendix A details the SETUP menus. Navigate through the SETUP menus to make changes to the transmitter configuration. The settings take effect immediately. The following are common field modifications to the factory default settings.

5.5.2 Selecting Actual and Standard Output Measurement Type

The transmitter is set from the factory to provide actual airflow measurement units (displayed as “ACFM” and “AFPM”). In this mode, airflow measurements are calculated for actual airflow conditions. If using actual airflow conditions, corrections for altitude are entered through the ALT= setting in the Setup menu. If desired, the output can be set to provide standard airflow measurement units (displayed as “SCFM” and “SFPM”) which provides measurements that are corrected to standard conditions.

5.5.3 Changing the LCD Display from Volumetric Flow CFM to Velocity FPM

The GTL116 transmitter is shipped from the factory to indicate volumetric flow. To display velocity in FPM, enter the SETUP menu and in the DISPLAY submenu, change the “*LCD UM=ACFM” to “*LCD UM=AFPM”.
5.5.4 Locking the Configuration Settings
The GTL116 transmitter configuration settings can be locked at one of three security levels within the SECURITY submenu using the LOCK SEC= item.

When LOW security level is selected (LOCK SEC=LOW) the last 4 digits of the board serial number are automatically assigned as the lock code. To see the board serial number, navigate to DIAGNOSTICS menu in SERIAL NUMBERS item.

When the MED security level is selected (LOCK SEC=MED) the user enters a security code. In the event that this code is lost/misplaced, EBTRON can provide a key that is unique to the transmitter to unlock it. Contact EBTRON customer service for this code.

When the HIGH security level is selected (LOCK SEC=HIGH) the user enters a security code. In the event that this code is lost/misplaced, the transmitter must be returned to the factory in order to unlock it.

**When LOCK SEC=HIGH is selected, the user defined setting can only be changed after entering the user defined code. STORE THE LOCK CODE IN A SAFE LOCATION! For security reasons, the HIGH level lock code can only be reset by returning the transmitter to the factory.**

5.6 GTL116 - Alarm Features

5.6.1 Alarm Indications
Table 11 details the alarm types and LCD indications available from the GTL116. User can select either or both of the two Average Alarms and the Trouble Alarm in the ALARM submenu.

5.6.2 Low Alarm - “LO ALRM= ON”
The Low Alarm is activated when the average airflow falls to a defined level below the SETPNT= value. The defined level is equal to the SETPNT= value minus the calculated value of (TOL= + value * SETPNT= value). Once active, the alarm can be cleared when the average airflow rises above the set point minus calculated tolerance value.

5.6.3 High Alarm - “HI ALRM= ON”
The High Alarm is activated when the average airflow rises above a defined level above the SETPNT= value. The defined level is equal to the SETPNT= value plus the calculated value of (TOL= value * SETPNT= value). Once active, the alarm can be cleared when the average airflow falls below set point plus calculated tolerance value.

5.6.4 LCD Trouble Alarm - “LCD TRBL=ON”
The transmitter Trouble alarm is selected in the DISPLAY submenu (LCD TRBL=ON) and provides trouble codes useful for isolating setup issues or problems within the transmitter or sensors. The transmitter LCD will indicate TROUBLE! The Diagnostic submenu can be engaged for the error code and a brief description of the trouble. Contact EBTRON customer service for information on troubleshooting using the Trouble error codes.

<table>

</tr>
</tbody>
</table>
5.7 Viewing Sensor Data

5.7.1 Viewing Sensor Data on the Local LCD Display
Airflow and temperature can be displayed on the local LCD display by entering the Diagnostic Menu. Simultaneously depress the up ↑ and down ↓ arrows to enter the GTL116 SETUP menu, and then navigate to the Diagnostic submenu.

5.7.2 Viewing Sensor Data via EB-Link Reader
Airflow and temperature of individual sensors can be downloaded directly to an EB-Link Reader if the infra-red EB-Link option has been installed. Refer to the following Sensor Addressing and Probe Positioning paragraph for the suggested probe installation configuration.

5.7.3 Sensor Addressing and Probe Positioning
Sensors are automatically addressed after power is applied to the transmitter as follows:
The probe connected to the left most connector, C1, is defined as probe 1. The sensor opposite the cable end of the probe is defined as sensor 1 when viewing individual sensor data. Refer to Figure 7 below for additional detail.

Note that if only average data is desired, the mounting position of the probes is not critical. When a probe is disconnected and then plugged in to a different port, the transmitter will re-discover it within 15 seconds and make any necessary addressing adjustments.

To standardize installation and decoding of data, particularly when using the EB-Link Reader product, EBTRON recommends a left to right (or top to bottom in vertical applications) sensor probe mounting convention as detailed in the separate sensor probe installation instructions.

6 SETUP MENUS
Appendix A details the various setup menus and submenus.

7 WIRING DIAGRAM
Appendix B is the wiring diagram for the GTL116 transmitter.

- `EB-LK INTG=300` → EB-LK INTG+300

TO PART 4

Set network protocol type.

Enter network address.

Set network baud rate.

Set MODBUS parity type.

Set network device instance number.

Set DHCP to ON or OFF.

Enter IP address, use (up/down arrow) buttons to select value and press ENT to move to right and ESC to move to left.

Enter subnet mask, use (up/down arrow) buttons to select value and press ENT to move to right and ESC to move to left.

Enter gateway IP address, use (up/down arrow) buttons to select value and press ENT to move to right and ESC to move to left.

Set BACnet IP or Ethernet protocol.

Set network device instance number.

EB-Link integration samples.
**GOLD SERIES GTL116 TRANSMITTER**

**FROM PART 3**

- **ALARM**
  - **LO ALRM=OFF**
    - **SET LO ALRM**
      - **LO ALRM=ON**
    - **HI ALRM=OFF**
      - **SET HI ALRM**
        - **HI ALRM=ON**
  - **ALRM UM=AFPM**
    - **SET ALRM UM**
      - **ALRM UM=ACFM**
  - **SETPT=0**
    - **SET SETPT**
      - **SET PT**
        - **TOL=10%**
          - **SET TOL**
            - **DELAY=2 min**
              - **SET DELAY**
                - **ZERO OFF=NO**
                  - **SET ZERO OFF**
                    - **ZERO OFF=YES**
                      - **SET ZERO OFF**
                        - **RESET=AUTO**
                          - **SET RESET**

**Gold Series GTL116 Transmitter**

Enables/disables flow adjustments.

Enter gain applied to airflow reading.

Enter offset applied to airflow reading.

Set OUT1 to % of full scale analog output.

Set OUT2 to % of full scale analog output.

Start field adjust wizard and enter number of integration samples to use.

The Field Adjust Wizard will now be engaged as outlined in the following steps. The gain and offset values will be updated, and FLOW ADJ=OFF will be set if the wizard is successfully completed.

"Wait: . . .%" indicates progress while the Field Adjustment Wizard acquires a large number of samples of airflow rate and averages all of the readings. Display indicates "ADJUSTMENT COMPLETE" when adjustment is complete.

If you wish to review the adjustment made, simply navigate back to the SETUP menu and view the ADJUSTMENTS section.

Sets security level to LOW. In this mode, there is no prompt for a lock code. The last 4 digits of the board serial are used to unlock.

Sets security level to MED. In this mode, a user defined code is specified. In the event of loss of code, contact EBTRON for a unique code for this transmitter to unlock and reset code.

Sets security level to HIGH. In this mode, a user defined code is specified. In the event of loss of code, transmitter must be returned to EBTRON for unlock / reset.

Enter code and confirm code (NOTE: if LOCK SEC= HIGH, DO NOT lose code!)

Reset ALL changes back to factory defaults. Transmitter resets after completion.

Resets sensor data. Transmitter resets after completion.

Resets network settings to factory default.

Clears all disabled trouble settings.
